

# Chaotic Agility

Agile RTP

Good things happen  
*when you let them*

# The Book

“Managing Software for  
Growth”  
by Roy Miller

# Manufacturing Software

- 1880, Frederick Taylor
  - Every job has “one best way”
  - Workers are dumb
  - Managers need more control

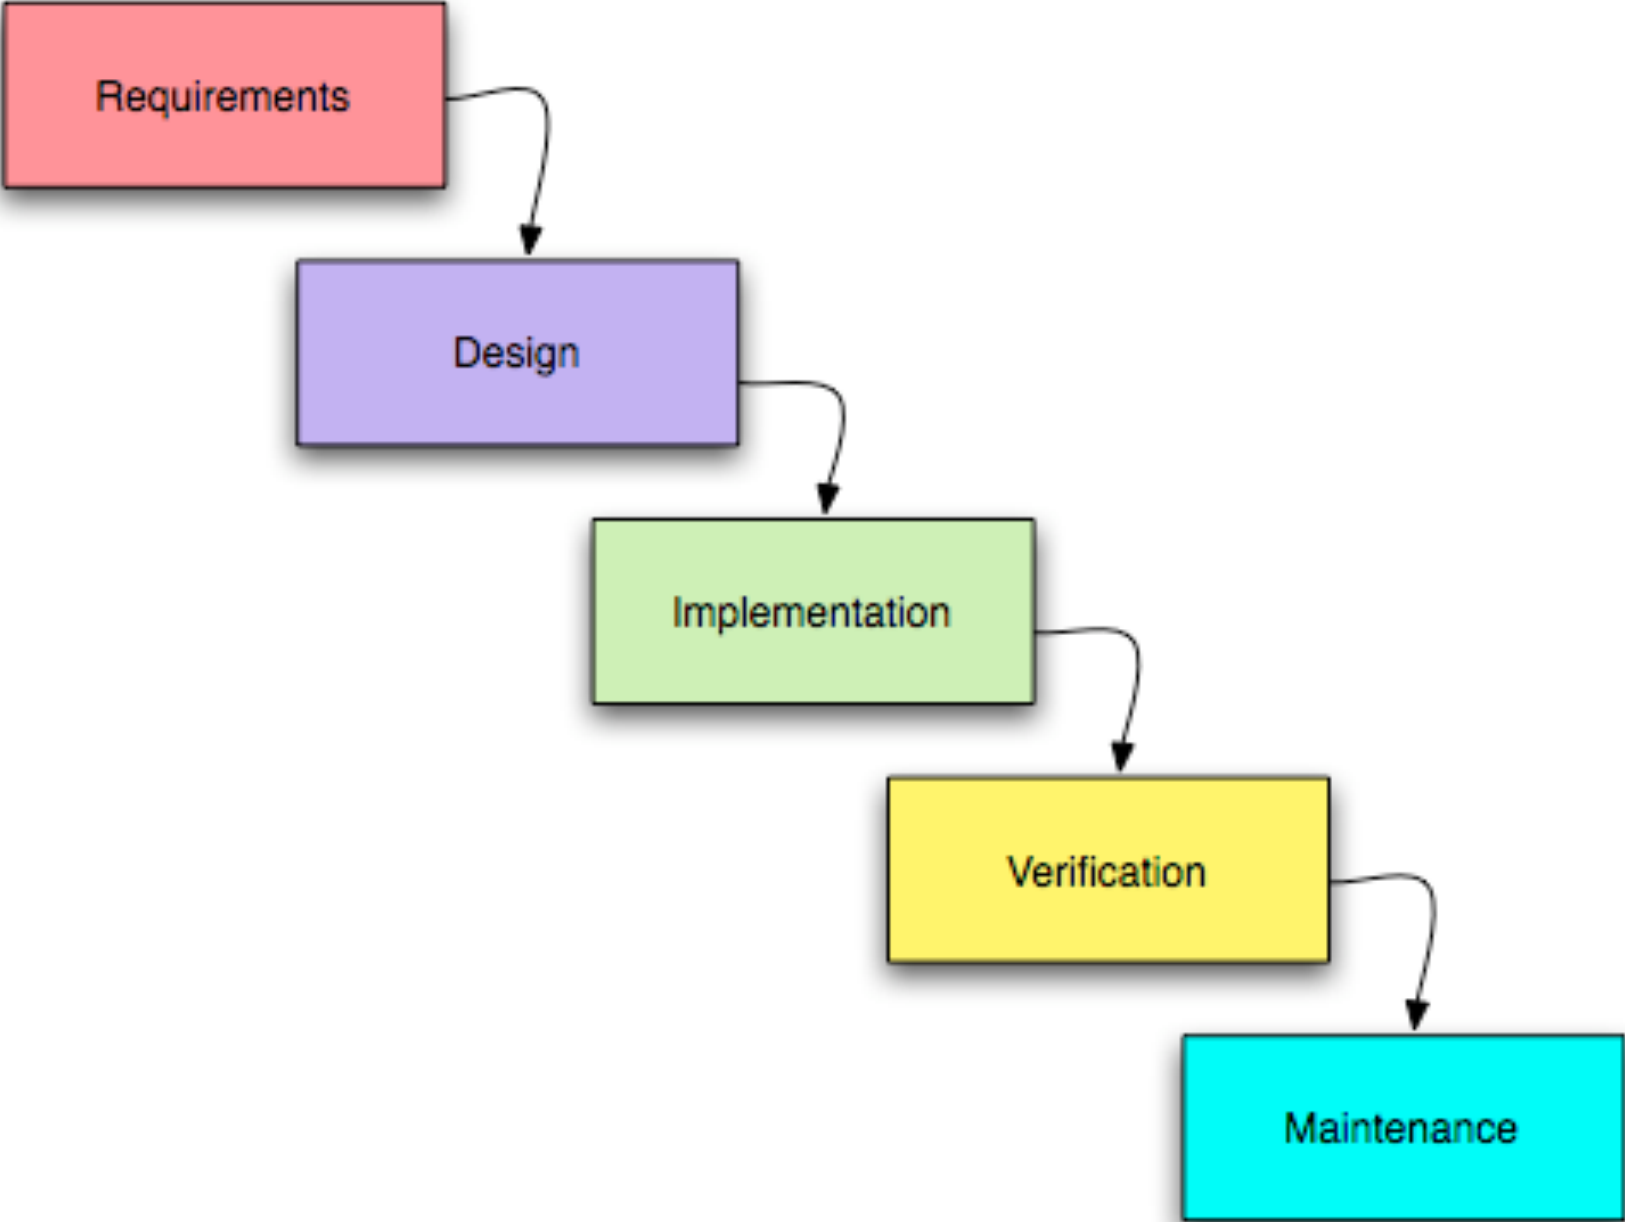

# The Manufacturing Mindset

- Determine what we want
- Design it
- Build it
- Make sure it works
- Repeat

*Assumption: The result will be the same every time the process is repeated.*

What does this remind you of?

# Manufacturing assumes linearity

- Whole equals sum of parts
- Effects proportional to causes
- Result is predictable

# Complexity science models reality

- Whole greater than sum of parts
- Small changes have big effects
- Patterns appear, but predictability remains elusive

When will it rain?

# Weather

- weather = function(sun, wind, humidity, CO<sup>2</sup>...)
- 1960, Edward Lorenz
- Toy weather
  - Small variations eventually disappeared
  - Until the program was started in the middle

# Attractors

- Emergent patterns
- Only show up during change
- Can't be created in advance
- Can't be predicted

## CAS

- John Holland
  - Networks of agents...
  - Acting in parallel...
  - Without central control
- 
- Constant change == life
  - Stability == death

# The Edge of Chaos

- A CAS must be stable...
- But not too stable...
- And not too chaotic
  
- Balance is key
- Where is the edge?

# Self Organization

- Minimize the number of choices, then make an educated guess
- It's the economy...
- Agents influence each other
- BarCamp, anyone?

# Growing Software

- Emergence
- Interaction
- Adjustment
- “Just Enough” / YAGNI
- What is “done?”

# Waterfall is Manufacturing

- Prediction is possible
- Software is an efficiency optimization problem
- Process over people

# Agility is a CAS

- Continuous change
- Good design
- Simplicity
- People working together
- What else?

# Take Aways

- For managers:
  - Stop trying to control and predict
  - Setup minimal structure
  - Make minor adjustments
- For developers:
  - Don't stress over perceived chaos
  - Be willing to experiment
- What else?

# Okay, who's the jerk?
